

Badawi Shop

Till and stock — how to use it

Screen by screen · 26 August 2026

What is in here

01	Opening the app	The app asks for a PIN every time it is opened. There is no email and no password to remember.
02	Serving a customer	Scan what the customer is buying, apply a discount if you are giving one, and take the money. Stock comes off by itself.
03	Keeping the shelves right	Everything the shop sells has to be in here once, with what it cost and what it sells for. That is where the profit figure comes from.
04	The figures	What sold, what it earned, and what needs reordering — for any stretch of days you choose.
05	Settings	The exchange rate and the screen lock.
06	On a computer	The same app, the same figures, laid out for a bigger screen.
07	If something is not right	The three things most likely to go wrong, and what to do.

Opening the app

The app asks for a PIN every time it is opened. There is no email and no password to remember.

Enter the PIN

- 1 Tap the four digits. The PIN is **2307**.
- 2 The shop opens as soon as the fourth digit is tapped. There is no OK button.
- 3 If a digit is wrong, tap the backspace key at the bottom right.

The PIN can be changed, or switched off, in Settings. Change it from 2307 if the phone leaves the shop.

The home screen

- 1 **Sell** is for serving a customer.
- 2 **Inventory** is for putting stock on the shelves.
- 3 Underneath, today's takings and profit so far.
- 4 **Reports and export** at the bottom for the figures.

The small amber dot at the top shows the exchange rate the app is using. Every pound figure in the app comes from it.

Serving a customer

Scan what the customer is buying, apply a discount if you are giving one, and take the money. Stock comes off by itself.

Start a sale

- 1 Tap **Sell** on the home screen.
- 2 Tap **Scan** and point the camera at the barcode.
- 3 The phone beeps and buzzes for each item. Keep scanning; the camera stays open.
- 4 For anything with no barcode, tap the magnifying glass instead.

A plugged-in barcode scanner works anywhere on this screen with nothing to switch on.

Items with no barcode

- 1 Tap the magnifying glass at the bottom left.
- 2 Pick a shelf along the top, or type a name in the search box.
- 3 Tap the item to put it in the cart.

This is how bread, loose sugar and anything sold by weight goes through the till. Greyed-out items have none left.

The cart

- 1 The total is at the top, in dollars and in pounds.
- 2 Use - and + to change how many.
- 3 Tap ✕ on the right to take a line out.
- 4 Scanning the same item again just adds one to it.

If a line turns amber, the shelf has fewer than the cart is asking for. The sale will be refused until it is corrected.

Sell Clear

PAID IN

US DOLLARS **\$5.35** LEBANESE POUNDS 476,000 L.L.

Note (optional)

Take \$5.35

Taking the money

- 1 Tap **Check out**.
- 2 Check the total. It is shown in both currencies.
- 3 Tap **US dollars** or **Lebanese pounds** for whichever the customer is paying with.
- 4 Tap the big amber button to record the sale.

Which currency was taken is recorded, so the end-of-day cash count can be checked against it.

Sell Clear

TOTAL

10 %

PAID IN

US DOLLARS **\$4.81** LEBANESE POUNDS 428,000 L.L.

Note (optional)

Take \$4.81

Giving a discount

- 1 Tap **Percent** for a percentage off, or **Amount** for a fixed sum off.
- 2 Type the number. Both totals update as you type.
- 3 Tap **None** to take the discount away again.

A discount can never take a sale below zero, however large a number is typed.

Change for the customer

- 1 The sale is now recorded and stock has come off.
- 2 Type what the customer handed over into **Cash given**.
- 3 The change appears underneath, in the same currency.
- 4 Tap **Next sale** for the following customer.

The reference under the total, such as #a1b2c3d4, is how a sale is found again in the exported spreadsheet.

Keeping the shelves right

Everything the shop sells has to be in here once, with what it cost and what it sells for. That is where the profit figure comes from.

What is in stock

- 1 Tap **Inventory** on the home screen.
- 2 Search by name, or by typing the start of a barcode.
- 3 Tap **Scan** to jump straight to an item by its barcode.
- 4 The number on the right of each row is how many are left.

In Inventory a scan finds the item. In Sell the same scan puts it in the cart. That is the only difference between the two modes.

What needs reordering

- 1 Tap **Running low** along the top.
- 2 Red means the shelf is empty. Amber means it is close.

Each article has its own alert level, so a slow-moving item is not flagged at the same count as a fast one.

Adding an article

- 1 Tap **New article**, then the scan button beside Barcode.
- 2 Type the name as it reads on the label.
- 3 Pick a shelf, then fill in **Cost price** and **Sale price**.
- 4 Enter how many you have, then tap **Save article**.

The box between the prices shows what you make on each one. It turns red if the sale price is below the cost, which is almost always a typing slip.

Save changes

Changing an article

- 1 Tap any item in the list.
- 2 Change the price, the name, the shelf or the alert level.
- 3 Tap **Save changes**.

The stock count cannot be typed over here. It moves through Restock, so every change leaves a record of what happened and why.

Almarai Water 1.5L

NAME
Almarai Water 1.5L

HOW MANY ARRIVED
0

+1 +6 +12 +24

New stock level **20** piece

Supplier or invoice (optional)

Add to stock

A delivery, or a miscount

- 1 Tap **Restock** on the article.
- 2 **Delivery** adds to what is already there. Use the +1, +6, +12 and +24 buttons.
- 3 **Correction** sets the count to what is actually on the shelf.
- 4 Check the new level, then save.

Use Correction after counting the shelf, and Delivery when goods arrive. Getting this the right way round keeps the count honest.

Shelves

- 1 Tap **Categories** at the top of Inventory.
- 2 Tap one to rename it or change its colour.
- 3 Tap **New category** to add one.

Deleting a shelf never deletes what was on it. Those articles simply become uncategorised.

The figures

What sold, what it earned, and what needs reordering — for any stretch of days you choose.

Choosing a period

- 1 Tap **Today**, **Yesterday**, **This week** or **This month**.
- 2 Tap **Custom** to pick any two dates.
- 3 **Day**, **Week** and **Month** change how the bars are grouped.
- 4 Tap any bar to read that day on its own.

Green is the profit; amber is what the goods cost. The two together are the takings.

Reading the figures

- 1 **Total sales** is what came in, after discounts.
- 2 **Profit** is what is left after what the goods cost.
- 3 **Average basket** is the takings divided by the number of sales.
- 4 **Taken in USD** and **Taken in LBP** is what to count in the drawer.

Every figure covers the period chosen at the top of the screen, and nothing else.

Best sellers and the export

- 1 Switch between **by quantity** and **by profit**. They are rarely the same list.
- 2 **Needs restocking** at the bottom is the shopping list.
- 3 Tap **Export to Excel** for the whole period as a spreadsheet.

On the phone the file is saved into Documents and the sharing menu opens, so it can go straight to WhatsApp, Drive or email.

Settings

The exchange rate and the screen lock.

The screenshot shows the 'Settings' screen of an app. At the top, there's a back arrow and the title 'Settings'. Below this, the 'EXCHANGE RATE' section is highlighted. It contains a text block explaining that prices are kept in dollars and sales already taken keep the rate they were taken at. Below this, the 'POUNDS PER DOLLAR' is set to '89000'. There are three buttons for 'ROUND POUND TOTALS TO THE NEAREST': '1,000' (selected), '5,000', and '10,000'. Below these, a text block shows '\$1.00 shows as 89,000 L.L.'. At the bottom of this section is a 'Save rate' button. Below the exchange rate section is the 'SHOP NAME' section, which shows 'Badawi Shop (demo)' and a 'Save name' button. At the bottom is the 'SCREEN LOCK' section, which has a text block explaining that the till asks for the PIN it was set up with (2307) when the app is reopened.

< Settings

EXCHANGE RATE

Prices are kept in dollars. This is what turns them into pounds on every screen. Sales already taken keep the rate they were taken at.

POUNDS PER DOLLAR

89000

ROUND POUND TOTALS TO THE NEAREST

1,000 5,000 10,000

\$1.00 shows as 89,000 L.L.

SHOP NAME

Badawi Shop (demo)

Save name

SCREEN LOCK

The till asks for the PIN it was set up with (2307) when the app is reopened.

The exchange rate

- 1 Type the number of pounds to one dollar.
- 2 Choose what to round pound totals to, so there is no hunting for small change.
- 3 Check the example underneath, then tap **Save rate**.

Changing the rate changes every pound figure in the app at once. Sales already taken keep the rate they were taken at, so old receipts stay correct.

The screen lock

- 1 **Choose your own** replaces 2307 with a PIN of your own.
- 2 **Reset** puts 2307 back.
- 3 **Lock now** locks the screen straight away.
- 4 **Turn off** stops it asking at all.

The PIN stops someone who picks up the phone reading your takings. It is not a lock on the data itself.

On a computer

The same app, the same figures, laid out for a bigger screen.

The wide layout

- 1 Sell, Inventory and Reports sit in a rail down the left.
- 2 The figures spread into columns instead of one long scroll.
- 3 A plugged-in barcode scanner works here exactly as it does on the phone.

It is the same shop and the same database. Anything done on the computer shows on the phone, and the other way round.

If something is not right

The scanner beeps but says the item is not in inventory

That barcode has not been added yet. Tap **Add it now** on the prompt: it carries the barcode across, so only the name and prices need typing. You come straight back to the sale.

An item will not go in the cart

The shelf is empty. Open Inventory, find the item and use **Restock**. The till refuses to sell what is not there rather than letting the count drift.

Nothing loads, or the figures are all zero

The phone has no connection. The app keeps its stock and its sales online so the phone and the computer always agree, which means it needs a signal to work. It will say so on screen.

The exported file cannot be found

It is in the phone's **Documents** folder, and the sharing menu opens as soon as it is made. The message on screen names the file.

A price was entered wrongly and things have already been sold

Fix the price in Inventory. Sales already taken keep the price they were sold at, so past figures do not move. Only sales from now on use the new one.
